Development of an Advanced Simulation System for the

Direct Particle-Particle interactions is the simplest way to perform an N-body simulation. It boils down to the following: 1.For each particle, accumulate all forces that other particles exhibit on it. 2.Use an integrator (Euler or Runge-Kutta for instance)[2] to update the positions and velocities of the particles accordingly.

High-performance particle simulation using CUDA

particle has a position vector $r(t)$ at time t . This is decomposed in the basis as $r(t) = x(t)\hat{e}_x + y(t)\hat{e}_y + z(t)\hat{e}_z$. (1.1.2) The functions $x(t)$, $y(t)$, and $z(t)$ are the particle's coordinates relative to the reference frame. The coordinates change as t varies, and the particle traces a trajectory in three-dimensional space.
