Estimating confidence interval for the binomial proportion is a challenge to statisticians and programmers when the proportion has zero frequency. The most widely used method based on Wald asymptotic statistics gives a degenerate interval, that is,  $(0, 0)$ , in this case.

Confidence Bounds on Time (Type 1) In order to calculate the bounds on a time estimate, the likelihood function needs to be rewritten in terms of one parameter and time, so that the maximum and minimum values of the time can be observed as the parameter is varied. This process is best illustrated with an example.

Exact confidence bounds following adaptive group sequential tests ... exact coverage is guaranteed provided the adaptation takes place at the penultimate stage. In general, however, all that can be claimed theoretically is that the coverage is guaranteed to be conservative.

stated confidence level and that only when the sample size is large. An exact confidence interval is valid for any sample size. An asymptotic confidence interval is valid only for sufficiently large sample size (and typically one does not know how large is large enough). Exact intervals are constructed as follows. Find a pivotal quantity  $g(X, \hat{p})$ .

Interpreting a Confidence Interval. The confidence interval is a random interval. The appropriate interpretation of a confidence interval (for example on  $\hat{\mu}$ ) is: The observed interval  $[l, u]$  brackets the true value of  $\mu$ , with confidence  $100(1-\alpha)\%$ . Examine Figure 8-1 on the next slide. Simulation on CI.

This approximation is the Normal approximation to the Binomial distribution, and it underpins a range of statistical tests and methods, including the calculation of accurate confidence intervals, performing goodness of fit and contingency tests, line- and model-fitting, and computational methods based upon these.

### Binomial confidence intervals and contingency tests

In other words, a binomial proportion confidence interval is an interval estimate of a success probability  $p$  when only the number of experiments  $n$  and the number of successes  $nS$  are known. There are several formulas for a binomial confidence interval, but all of them rely on the assumption of a binomial distribution.
