The standard LSTM cell has a linear unit with a recurrent self-connection with weight 1.0 (CEC). Input and output gate regulate read and write access to the cell whose state is denoted  $s_t$ .

Our remedy is a novel, adaptive forget gate that enables an LSTM cell to learn to reset itself at appropriate times, thus releasing internal resources. We review illustrative benchmark problems on which standard LSTM outperforms other RNN algorithms.

Previous work on learning regular languages from exemplary training sequences showed that Long ShortTerm Memory (LSTM) outperforms traditional recurrent neural networks (RNNs).

Our remedy is a novel, adaptive “forget gate” that enables an LSTM cell to learn to reset itself at appropriate times, thus releasing internal resources. We review illustrative benchmark problems on which standard LSTM outperforms other RNN algorithms.

remembering the meaning and the writing of the kanji “perhaps the single most difficult barrier to learning Japanese” can be greatly simplified if the two are isolated and studied apart from everything else. Forgetting kanji, remembering kanji What makes forgetting the kanji so natural is their lack of connec-

time by using input and forget gates in LSTMs and resetting the memory via the reset gate of a GRU. This feature also brings modularity to the neural network design that seems to make training of those models easier. Gated RNNs are also empirically shown to achieve better results for a wide variety of real-world tasks.
